Paycheque split planner

Replace the sample figures before you rely on the result.

A split is a rule you set before the month starts. The sample sends 55% of R28,500 to bills, 20% to savings, 20% to spending, and 5% to giving. Change the shares. The check row must equal 100%.

How to use the workbook

1. Put net pay in C2.
2. Edit the four shares in column B. They are percentages, so 20% is 0.2.
3. Look at row 7. If the share check is not 1, the plan is incomplete.
4. Transfer the rand amounts the morning after payday, starting with bills and savings.

Worked example

Bills are R15,675 in the sample.

- Savings and spending are R5,700 each.
- Giving is R1,425.
- The four shares add to 100% and the rand adds back to R28,500.

A practical routine

- If a debit order is larger than the bills amount, fix the share before payday.
- Do not use the spending amount to cover a bill you forgot.
- Rewrite the split when your net pay changes.

This workbook organises figures you type in. It is not financial, credit, insurance, or tax advice. Rates, fees, and laws change. A qualified adviser should review decisions that affect debt, tax, medical cover, or retirement.
